This Informational Retrieval system use Apache Lucene version 3.6 and Java SE 1.8.

This system is able to create an index of all text- and html-files contained in folder. The user must put the files in the folder "filesToIndex" (the disadvantage of the program is that it can not work with subfolders). After starting the program, the user can enter a search query or a phrase "ex" to exit the program.

The result is the number of files that contain this query and the full path to these files.

This Informational Retrieval system was developed by Maksym Yakymets.
